Python Summer Course

Course 3: Files, Data & Practice

Théophile Gentilhomme July 29, 2025

Installing Python Packages

Most functionality in Python comes from external packages (libraries).

Install with pip (Python's package installer)

```
1 !pip install numpy
```

Run this in:

- Jupyter notebooks (with !)
- Google Colab
- Terminal/command line (without !)

Importing a Package or Module

Once installed, use import to load the package in your code.

Import with Alias

Import Specific Functions

```
Python Code ⊕ Start Over

1 from math import pi, sin
2
3 print(sin(pi / 2)) # 1.0
```

Best Practice:

- Use standard aliases: np for numpy, pd for pandas, plt for matplotlib
- Only import what you need to keep code clean

Reading and Writing Files in Python

Python can read from and write to files using the built-in open () function.

Reading from a Text File

Notes:

- "w" mode = write (overwrites file)
- "r" mode = read
- "a" mode = append
- Always use with so auto closes the file
- More functionalities (e.g. line by line) but we focus on specifc formats here

JSON: Storing Structured Data

JSON (JavaScript Object Notation) is a text format for storing **structured data**, like Python dictionaries and lists.

It's widely used in APIs, configs, and data exchange.

```
Python Code Start Over

1 import json
2
3 # this is our dict
4
5 data = {"name": "Alice", "age": 30, "skills": ["Python", "Data"]}
```

Save to JSON File

Load JSON File

JSON ↔ **Dictionary**

- json.dump() → save to file
- json.load() → read from file
- json.dumps() / json.loads() → convert to/from string

JSON uses:

- {} for objects (dicts)
- [] for arrays (lists)
- Keys must be strings

Study Case: Modeling Bacterial Colony Growth

We will work with simulated growth data of bacterial colonies under different conditions.

Objectives:

- 1. Load and inspect the dataset (JSON)
- 2. Create a Colonie class to represent each colony
- 3. Implement a method to predict growth at a given time
- 4. Create and test colony objects from data
- 5. Compare predicted vs actual growth data

Step 1: Load Dataset from JSON

- Open and parse the JSON file using json.load()
- Check structure: list of colonies, each with conditions + growth

Solution

Enter code

Show Solution

Step 2: Define a Colonie

Attributes:

• name, temperature, ph, sugar

Method

- predict_growth(time)
- math package for exp, log functions

Using formula:

$$G(t) = S \cdot e^{-rac{(T-37)^2}{20}} \cdot (1 - 0.3 \cdot | ext{pH} - 7|) \cdot \ln(t+1)$$

Solution

Show Solution

Enter code

Step 3: Create Objects and Compare Predictions

- Loop over data entries
- Create a Colonie object for each
- Predict growth at fixed times (e.g. 3, 5, 8)
- Compare with actual values in the dataset

Solution

Show Solution

Enter code
